Mountain Weather Forecast

Ground Conditions Supplement

Date: Monday 9 December 2024 Location: Blencathra summit 868m at 10:48 UTC. Full report: Today's report is from the northern fells - Blencathra summit. With ground conditions likely remaining similar on the Helvellyn range as yesterday, the daily report is centred on Blencathra and the northern fells area. Yesterday's light snow covering on the Blencathra summit area is now only isolated and avoidable remnants of thawing ice, the freeze line was just above summit level leaving rocky areas damp and greasy. Sharp Edge, for example, was ice free but is especially greasy in cold damp conditions and care is still definitely required. Looking across the northern fells, most tops were cloud free intermittently and higher western fells, such as Great Gable, appeared to be snow free. The Helvellyn range remained in cloud throughout but is likely still holding some winter conditions as reported yesterday. Tomorrow expect more settled weather, summits are likely to be clear at times and the wind speeds should be much lower than recent days, after an early frost the freeze line is due to be above summit height so remaining areas of snow and ice may recede further. Full winter clothing will still be required and micro spikes will still be useful where rime ice and snow remains, the Helvellyn ridges for example. Temperature: plus 0.5 C, Maximum wind speed 38.5 mph, Wind chill: minus 9.8 C, Average wind speed: 28.4 mph
